

Review 2nd Meeting

Text classification

Not bert for yet, because need to learn about PyTorch.

Try some things with PyTorch, quite good results.

Hugo should run the 3 steps several times. Prblm about mesh mapping solved but some deases have not a lot of samples

Classification : first crossentropy but then found with some research that hugo should use BCE but actually he missed something bcs it's Binary but it should be Ok.

Found recent architecture of Bert trained on medical data -> finetune this.

Or use it as an encoder ? can do both

Image classification

For the model created, this is ok it's working, but we need to train it because otherwise it's very long.

For the model Fine tune

To overcome the overfitting problem, the professor proposed the scheduled learning rate, stratified split, and perhaps training only the head.

Dicom

We can split the images so we have less to carry

Use IA

Maybe to complicated, cannot use chatgpt for exemple
